REASONS FOR ALLOWANCE

The following is an examiner's statement of reasons for allowance: The prior art does not teach or fairly suggest the apparatus and method claims as recited in independent claims 1 and 10 of the instant invention comprising, *inter alia* an objective optical system configured to be implemented in a tip of an endoscope comprising, first and second lens barrels engaged with one another along a common axis, having first and second optical system therein and a fixing unit having a threaded surface used to fix the first optical system within the first lens barrel and define a clearance between the first and second lens barrels and comprising an alignment lens within the first lens barrel which is movable in a direction perpendicular to an optical axis via pins inserted into a plurality of unthreaded holes of the first lens barrel.

Onda (U.S. Patent No.6,590,721) discloses a first lens unit having a first lens barrel 1 and a first optical system including a plurality of lens 2, 3 elements assembled in said first lens barrel and aligned in a direction of a first common optical axis (see Fig. 1 and Col. 3, Lines 1-10) wherein said first lens unit includes an alignment lens 2 movable in a direction perpendicular to an optical axis thereof, movement of the alignment lens in the direction perpendicular to the optical axis alone adjusting an alignment of the entire plurality of lens elements assembled in the first lens unit (see Fig. 1), said first lens barrel being formed with a plurality of unthreaded holes 7 through which parts of a circumferential surface of said alignment lens are exposed (see Fig. 2), said alignment lens movably accommodated in said first lens barrel, and said alignment lens moved, in the direction perpendicular to the optical axis, by pins inserted through

said plurality of holes, respectively (see Col. 4, Lines 1-20). However, Onda is silent with respect to a second lens unit having a second lens barrel, engageable with said first lens barrel, and a second optical system including a plurality of lens elements aligned in a direction of a second common optical axis, and wherein, when the first lens barrel is engaged with the second lens barrel. Furthermore, Onda is silent with respect to a fixing unit (i.e. holding ring 93 of instant invention) having a threaded surface which is used to securely engage the first and second lens barrels to one another as well as accurately position the various lenses within the first lens barrel. Thus, Onda fails to meet the current limitations of the claims of the instant invention.

Tsuyuki et al. (U.S. Patent No. 5,547,457) disclose an objective optical system configured to be implemented in a tip of an endoscope, comprising: a first lens unit having a first lens barrel 30 and a first optical system 29 including a plurality of lens L1, L2, L3 elements assembled in said first lens barrel and aligned in a direction of a first common optical axis; and a second lens unit having a second lens barrel 11, engageable with the first lens barrel, and a second optical system including a plurality of lens L4, L5 elements aligned in a direction of a second common optical axis, wherein, when the first lens barrel is engaged with the second lens barrel, the lens elements of the first and second lens barrels are aligned along a common axis, the first common axis and the second common axis comprising the common axis (see Figs. 5-6 and col. 8, Lines 18-67). However, Tsuyuki et al. also fail to disclose a fixing unit having a threaded surface which is used to position the first optical system within the first lens barrel as well as securely engage the first and second lens barrels to one another.

Furthermore, Tsuyuki et al. fail to teach or fairly suggest alignment of an individual lens, by pins or by any other mechanism. Thus, Tsuyuki et al. fail to meet the current limitations of the claims of the instant invention.

Wilczynski et al. (U.S. Patent No. 3,560,080) disclose an optical instrument comprising one or more adjustable lens elements and rings, the elements and rings being encased in a cylindrical barrel 33 formed with slots 30, 31, 32 or apertures for a wide range of openings so that lateral and rotative adjustment may be made in all directions to compensate for deficiencies in the manufacture of the separate elements making up the instrument (see Col 2, Lines 47-55). However, each individual lens element of Wilczynski et al. must be separately adjusted and thus there is no particular alignment lens such that movement of the individual lens alone, in a direction perpendicular to an optical axis, performs an alignment of all the plurality of lens elements of the first unit as required by the instant invention. Wilczynski et al. also provide a series of axially extending slots rather than an unthreaded hole that exposes parts of an alignment lens without exposing the circumferential surfaces of the other lenses within the first lens unit. Thus, Wilczynski et al. fail to meet the current limitations of the claims of the instant invention.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
